Executive Inventory Overview Page:
This page delivers a **high-level diagnostic of inventory health, financial performance, and capital efficiency** across the retail portfolio.

Business/Executive Question:
Is our inventory aligned with actual demand patterns?
Are we deploying capital efficiently, or is it locked in underperforming stock?

What This Page Shows:
This page provides a **strategic snapshot of the relationship between sales performance and inventory investment**, enabling leadership to quickly assess efficiency and risk exposure.

KPIs: Total Sales, Units Sold, Inventory on Hand, Inventory Turnover, Days of Inventory Coverage, At-Risk Products.

Despite stable sales performance—indicating consistent demand—inventory levels remain elevated. This suggests **potential inefficiencies in stock allocation and capital utilization**.
Inventory turnover reflects **moderate movement**, highlighting the presence of slower-moving stock. Meanwhile, Days of Inventory Coverage provides a forward-looking indicator of whether inventory levels are excessive or insufficient relative to demand.
The KPI structure is intentionally layered:

- First: **Financial performance (Sales)**
- Second: **Operational alignment (Inventory)**
- Third: **Risk exposure (Coverage & At-Risk signals)**

This ensures executives evaluate performance **holistically**, avoiding disconnected decisions between commercial and supply chain functions.

Decision horizon: Strategic (Capital allocation, portfolio optimization, risk prioritization).

Decision Impact: Executives can:

- Validate whether inventory investment is justified by demand
- Reallocate capital away from low-performing or slow-moving categories
- Set inventory optimization targets (reduction or expansion)
- Detect early warning signals for overstocking or stockouts
- Prioritize categories or regions for deeper operational analysis
- Trigger drill-down investigations into root causes

Sales, Demand & Region Page:
This page analyzes **where demand originates and how evenly it is distributed across regions**, revealing whether growth is diversified or concentrated.

Business/Executive Question:
Where is demand strongest, and are we aligned to capture it effectively across regions?

What This Page Shows: This page distinguishes between **volume-driven growth (units sold)** and **value-driven growth (revenue)**—a critical lens for margin-aware decision-making.
It highlights:
- Sales and units sold by region and store
- Geographic demand concentration
- Regional contribution to total revenue

The analysis reveals that **demand distribution is uneven**, with certain regions consistently outperforming others. This indicates:
- Strong localized demand drivers in high-performing regions
- Potential under-supply or misalignment in weaker regions

Regional variance becomes a key signal for intervention—whether through **inventory rebalancing, pricing strategies, or promotional activity**.

Decision horizon: Tactical (Regional optimization, replenishment planning, demand alignment).

Decision Impact: Operations and regional managers can:
- Prioritize high-demand regions for replenishment.
- Reallocate inventory toward stronger-performing markets.
- Adjust regional supply strategies based on demand patterns.
- Identify demand hotspots with insufficient inventory.
- Align sales strategies with product availability.
- Intervene in underperforming regions with targeted actions.

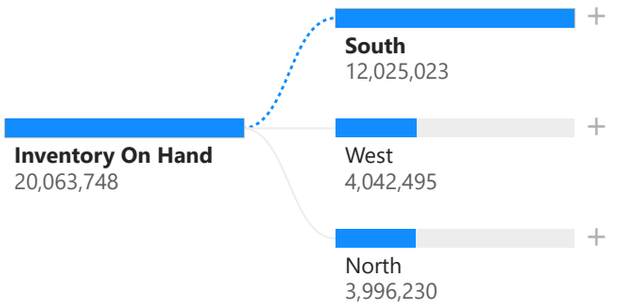
Inventory Distribution Across Regions & Categories

Region



Inventory Risk & Action Page:
This page is designed to **translate insight into immediate operational action**, focusing on high-risk products and inventory imbalances.

Business/Executive Question:
Which products present immediate risk, and what actions are required right now?.

What This Page Shows:
This page combines **demand velocity and inventory position** to identify actionable risks.
Core Metrics:
- Stockout Risk
- Inventory vs Sales Gap
- Days of Inventory Coverage
- At-Risk Products (by SKU and location)

Products with **high sales velocity but low coverage** represent immediate stockout risk and potential revenue loss.
Conversely, products with **high inventory but weak sales** indicate overstock and inefficient capital allocation.
The analytical approach is intentional:
- Focus on **rate-based metrics (velocity, coverage)**
- Avoid reliance on static inventory levels

This ensures decisions are based on **true demand dynamics**, not misleading absolute quantities.
"At-risk" products are defined by **imbalance**, not just low stock—preventing unnecessary interventions where demand is weak.

Decision horizon: Operational / Strategic Execution (Immediate actions + capital efficiency).

Decision Impact: Executives can immediately:
- Reduce excess inventory tied to slow-moving SKUs
- Expedite replenishment for high-risk, high-demand products
- Prevent revenue loss from imminent stockouts
- Execute SKU-level actions with precision
- Shift from insight to **direct operational decisions**

Time Intelligence Page:
This page delivers a forward-looking view of demand trends and inventory alignment, enabling proactive planning rather than reactive decisions.

Business/Executive Question:
“Is demand accelerating, stabilizing, or declining?”.
“How should inventory strategy adapt to these trends?”.

What This Page Shows:
- Month-over-Month demand momentum.
- Year-over-Year growth trends.
- Seasonality and demand patterns.
- Inventory alignment with demand signals.

KPIs: Units Sold MoM, Units Sold YoY.

Time-based comparisons provide essential context that static KPIs cannot.
- Rising MoM demand combined with declining inventory coverage signals **imminent stockout risk**
- Slowing demand with stable or rising inventory indicates **potential overstock and working capital inefficiency**

This page transforms time-series data into actionable signals, allowing decision-makers to anticipate changes rather than respond after the fact.

Decision horizon: Tactical → Forward Planning.

Decision Impact:
- Proactively adjust replenishment based on demand momentum.
- Detect and plan for seasonal demand fluctuations.
- Improve forecast accuracy through trend validation.
- Prevent stockouts and excess inventory.
- Align procurement cycles with real demand patterns.

Pareto (ABC) Analysis Page:
This page applies the Pareto principle to identify the products that disproportionately drive revenue and require focused inventory investment.

Business/Executive Question:
“Which products generate the most value, and where should we prioritize inventory and capital?”.

What This Page Shows:
- Product ranking by revenue contribution.
- Cumulative sales percentage.
- ABC classification (A, B, C tiers).
- Pareto curve with 80% and 95% thresholds.

A small subset of products (A-category) drives the majority of revenue — a classic Pareto distribution.
By visualizing cumulative contribution, this page shifts decision-making from **managing all products equally** to **prioritizing high-impact SKUs**.
- **A-products:** Critical revenue drivers → must be protected
- **B-products:** Moderate contributors → managed efficiently
- **C-products:** Low impact → often overstocked and resource-draining

The 80% and 95% thresholds provide a clear, intuitive prioritization framework for both technical and non-technical stakeholders.

Decision horizon: Strategic (Capital Allocation & Portfolio Optimization).

Decision Impact:
- Prioritize availability of high-value products.
- Apply differentiated inventory strategies by category.
- Reduce capital tied up in low-performing SKUs.
- Streamline operations and assortment.
- Optimize shelf space and product mix.

Product Drill-Through Page:
This page connects executive insights with operational detail, enabling deep, product-level diagnosis.

Business/Executive Question:
“What is driving this product’s performance?”.

What This Page Shows:
- Product-level demand trends
- Inventory behavior and efficiency
- Stock coverage and risk exposure
- Regional and category performance context

This page enables root-cause analysis by maintaining context from higher-level dashboards.
Workflow:
1. Identify an issue at summary level
2. Drill through into a specific product
3. Instantly analyze demand, inventory, and risk drivers

This eliminates guesswork and replaces it with structured, data-driven investigation.

Decision horizon: Operational / Diagnostic.

Decision Impact:
- Distinguish between systemic vs product-specific issues
- Enable faster, data-driven decision-making
- Support cross-functional alignment (analytics, supply chain, merchandising)
- Accelerate issue resolution and performance optimization
